COSC 1336 – Programming Fundamentals I
Program 12 – Classes and Object-Oriented Programming

The owners of the Annan Supermarket would like to have a program that computes the monthly gross pay of their employees. The user will enter an employee's first name, last name, the hourly rate of pay, and the number of hours worked for the month. In addition, Annan Supermarkets would like the program to compute the employee's net pay and overtime pay. **Overtime hours, any hours over 40 for the week, are paid at 1.5 the regular hourly rate.** Net pay is gross pay minus taxes (Refer to the tax table on the second page).

Define a class called **Employee.** The class must have **private attributes** to store the employee's name, hourly rate, and regular (≤ 40) and overtime hours worked. The class must also have methods to perform the following tasks:

- A constructor to initialize the hourly rate to the minimum wage of $7.25 per hour and the hours worked (regular and overtime) to 0.0.

- A method to get (a setter/mutator method)
  - the employee's name
  - the hourly rate
  - the hours work for the month (**by the week – assume 4 weeks in a month**). Do not write separate setters for regular and overtime hours.

- A method to return (a getter/accessor method)
  - the employee's name
  - the hourly rate
  - the total regular hours work for the month
  - the total overtime hours for the month

- A method to return (a getter/accessor method)
  - the monthly regular pay

- A method to return (a getter/accessor method)
  - the monthly overtime pay

- A __str__ method to display the output which must include the following information:
  - Employee's name
  - Total regular hours worked
  - Total overtime hours worked
  - Total hours worked
  - Pay rate
  - Monthly Regular Pay
  - Monthly overtime pay
  - Monthly gross pay
  - Monthly taxes
  - Monthly net pay

Write a main function that declares an object for the class defined and test the functions and methods written for the class. Allow the user to run the program as many times as possible. **No input, processing, or output should happen in the main function. All work should be delegated to other functions**. Include the recommended minimum documentation for each function. See the program one template for more details.

You will not get credit if the program is not written or does not work as expected.

Tax Table

Bracket	If the gross pay is over	But not over	Tax
1	$0.00	$2,000.00	10%
2	$2,000.00	$3,500.00	15%
3	$3,500.00	$6,000.00	28%
4	$6,000.00	$10,000.00	31%
5	$10,000.00	N/A	36%

Run 1

Name: John Doe
Hourly rate: $35.10
Hours worked: 40, 30, 40, 35

Run 2

Name: Jane Doe
Hourly rate: $37.20
Hours worked: 40, 40, 40, 40

Run 3

Name: <Your Name (First Last) >
Hourly rate: $65.50
Hours worked: 50, 35, 40, 55

Run the program three times with the data below and save the output as **Program12-output.py** (Do a "Save As" in the Python Shell Window and it will save as a ".py" file. See Appendix B of your Textbook for more details). Create a folder named, **Fullname_Program12**. Copy your source code and the output file to the folder. Zip the folder, as a **".zip**" file, and upload it to Blackboard.
